

Merton/KMV Model

Enbridge Inc. [TSX:ENB]

Credit Risk Analysis

Haoran (Alex) Yu

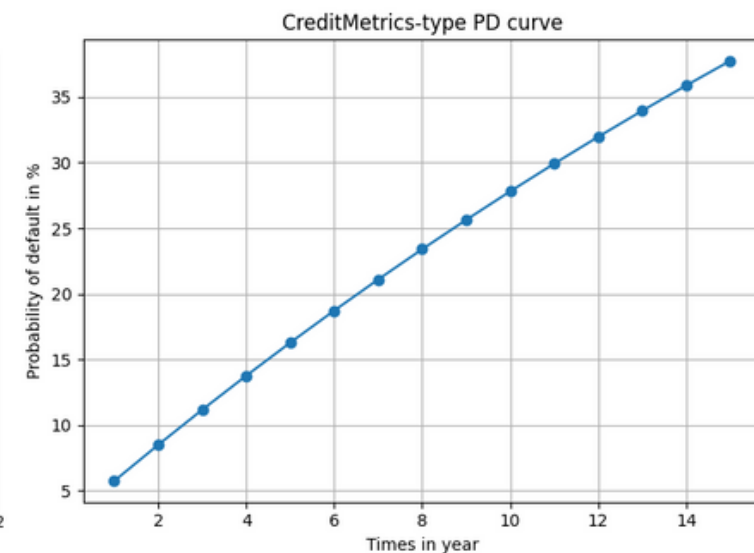

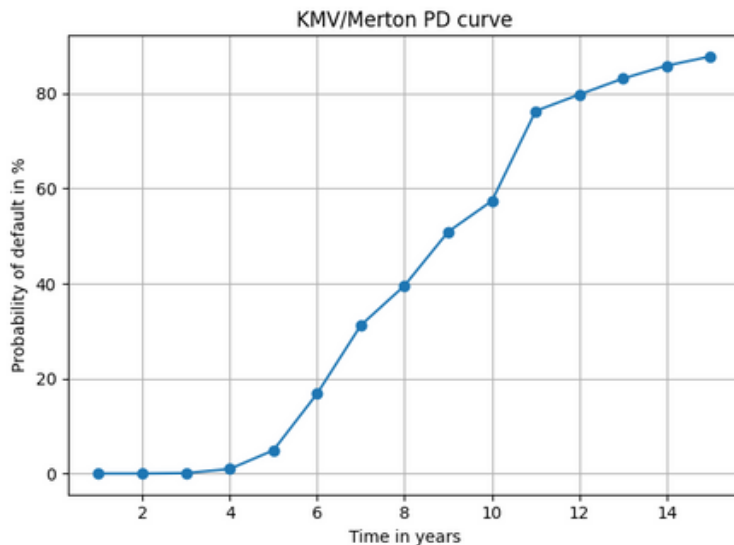

CreditMetrics Model

For the Merton/KMV model:

- Risk-free rate = The yields from the Canadian T-bill that matures in the next 15 years from Market insider as April 25.
- Stock volatility is calculated annually using all daily closed stock prices from 2010 to 2025 provided by Yahoo Finance.
- Asset volatility is calculated using the iteration approach for different time periods. Initial guess is assumed to be equal to the respective annual stock volatility.
- From Yahoo finance, by Dec 31 2024, we used the market cap of 132.88B CAD with total debt 103.01B CAD.

Table 1: Volatility and risk-free rate over 15 years

| Year | Risk-free rate | Annualized stock volatility | Estimated asset volatility |
|------|----------------|-----------------------------|----------------------------|
| 1 | 0.0274 | 0.138719 | 0.0797796 |
| 2 | 0.0262 | 0.224799 | 0.131644 |
| 3 | 0.0267 | 0.269207 | 0.160758 |
| 4 | 0.0276 | 0.30418 | 0.185988 |
| 5 | 0.0283 | 0.358387 | 0.227176 |
| 6 | 0.0293 | 0.450046 | 0.306713 |
| 7 | 0.0301 | 0.52737 | 0.390266 |
| 8 | 0.0308 | 0.55629 | 0.433134 |
| 9 | 0.0315 | 0.610433 | 0.504672 |
| 10 | 0.032 | 0.633025 | 0.541675 |
| 11 | 0.0322 | 0.787199 | 0.727329 |
| 12 | 0.0322 | 0.800775 | 0.750762 |
| 13 | 0.033 | 0.820834 | 0.780167 |
| 14 | 0.033 | 0.836688 | 0.803205 |
| 15 | 0.033 | 0.845211 | 0.817077 |

For the CreditMetrics model with two-state Markov transition matrix with constant recovery rate of 50%:

- When there is a gap between the maturities, we will use subsidiary companies corporate bond. And small differences between different maturities of corporate bonds and respective government T-bills are assumed to be not impactful for the yields.
- Since ENB issues corporate bonds in USD, we will use US government T-bills. And all yields are from April 25th, 2025.
- The corporate bond is gathered from TradingView, and T-bills are gathered from Market Insider.

Table 2: Enbridge bonds

| Bond name | Maturity date | Yields |
|------------|---------------|--------|
| ENB4296382 | 2025-10-15 | 0.0544 |
| ENB5271981 | 2026-10-04 | 0.0459 |
| ENB4513419 | 2027-07-15 | 0.0448 |
| ENB5698929 | 2028-11-15 | 0.0471 |
| ENB4912102 | 2029-11-15 | 0.0478 |
| ENB5698930 | 2030-11-15 | 0.0498 |
| ENB3703678 | 2032-07-15 | 0.0562 |
| ENB5210531 | 2033-08-01 | 0.0529 |
| ENB3706968 | 2034-12-15 | 0.0565 |
| ENB3674174 | 2038-04-15 | 0.0605 |
| ENB3685015 | 2040-09-15 | 0.0598 |

Table 3: US T-bills

| Bond name | Maturity date | Yields |
|--------------|---------------|--------|
| US91282CAQ42 | 2025-10-15 | 0.0022 |
| US912828YG91 | 2026-09-30 | 0.0391 |
| US91282CKZ31 | 2027-07-15 | 0.0377 |
| US912810PZ57 | 2029-01-15 | 0.0255 |
| US912828YS30 | 2029-11-15 | 0.0385 |
| US91282CAV37 | 2030-11-15 | 0.0398 |
| US91282CEZ05 | 2032-07-15 | 0.018 |
| US91282CHP95 | 2033-07-15 | 0.0414 |
| US91282CLF67 | 2034-08-15 | 0.0424 |
| US912810PX00 | 2038-05-15 | 0.0442 |
| US912810QK79 | 2040-08-15 | 0.0462 |

For each period, after calculating the spread, we found the geometric average of the spread to be 1.47049% in the next 15 years. So, we have the matrix to be:

$$M = \begin{bmatrix} 0.97080538 & 0.02919462 \\ 0 & 1 \end{bmatrix}$$
